

Students' views on the cognitive discursive approach

We are used to working on the Internet, and I believe, it is more convenient to learn something without books. We can do our homework everywhere just with the help of our phone or lap-top and Internet connection. One other advantage is that we can easily copy out new words and put them into the dictionary line in order to translate them quickly and correctly. Besides, if we don't know the meaning of some words, we can consult Google. Moreover, we can print our tasks instead of writing in order to save time. In addition, we can find a lot of interesting information which on a particular topic.

I believe that the system may become the next big thing. We re-energise standards of education using not just books or method guides, but gadgets and online sources which may be helpful for our future career. Moreover, we feel that this a little bit unusual way of studying will certainly help us become proficient speakers, as it lends variety to education system. As for the negative characteristic, I only mention, that reading BBC texts we spend more time before the computer screen which may harm our eyesight.

Studying by means of using fresh BBC news is quite beneficial since it keeps us in touch with the ongoing trends in the English language system and global cultural life. On account of that fact that we are kept focused on the latest pieces of news, we respectively encounter the language in its current customary form which is used by native speakers. Thus, we learn a modern functional language (in contrast to the previous method) which is exceedingly crucial for learners in order not be lexically old-fashioned and sound odd. Besides, it is the best-of-both-worlds position since we also get to know some new information about what is going on in the world.

This system also has some minuses. The first minus is that students need time to get used to it. The system is unusual in comparison with studying with the help of books. The next minus is that there can be difficulties with some of the tasks. Judging from my own experience, the tasks to single out constructions, to check their usage and to simplify articles are complicated. But after some time and practice the difficulties can be overcome.

All in all, I believe that this system is useful and we should stick to it because of its innovative form.
